

ABSTRACT OF THE DISCLOSURE

A server displays a co-evaluation request containing an evaluation scheme of a first component user on a homepage. A second component user browsing this co-evaluation request through a terminal device transmits a proportion of user's own assignment as an answer to the server. The server displays the proportion of assignment of the second component user on the homepage. Thereafter, each of the first component user and the second component user transmits an evaluation result of the co-evaluation to the server. The server displays each evaluation result received on the homepage. The first and second component users exchange the evaluation results through the homepage, and can share the co-evaluation results on the homepage.
